

Standup 2: Literature Review and Research Question Framing

This week was dedicated to reviewing existing literature on credit scoring and behavioral finance. Prior studies highlighted how non-financial factors such as trustworthiness and impulsivity influence repayment behavior, reinforcing the motivation for this project. Other research demonstrated improved prediction performance when behavioral data is incorporated alongside financial variables.

A key challenge was balancing academic depth with clarity. Many studies use dense terminology that can obscure the underlying insight. I addressed this by focusing on conceptual findings rather than excessive technical detail.

Next week, I will finalize the five research questions based on identified gaps in prior work. Documentation will summarize relevant studies and explicitly connect them to the project's analytical objectives.
