

Standup 3: Dataset Exploration

This week focused on initial exploration of the dataset, which contains 100,000 observations and 28 variables sourced from Kaggle. The dataset includes demographic, behavioral, and financial attributes relevant to credit scoring analysis.

The volume and dimensionality of the data presented an early challenge. Identifying which variables were meaningful required systematic exploration through descriptive statistics and visual inspection.

In the coming week, I will begin data cleaning and transformation, with particular attention to skewed variables and missing values. All exploratory findings will be documented to establish a clear baseline of the raw data.
