

Standup 6: Payment Delay Analysis

This week involved examining the impact of payment delays on credit scores using the Kruskal–Wallis test. Results showed statistically significant differences across credit categories, with Good scores associated with shorter delays and Poor scores with substantially longer delays.

Interpreting exceptions, such as borrowers with minimal delays but poor scores, highlighted the multifactor nature of credit evaluation.

Next week, I will conduct post-hoc pairwise comparisons using Dunn's test. Statistical outputs and visualizations have been documented for clarity.
