

Standup 7: Post-hoc Dunn's Test

This week, I performed Dunn's post-hoc tests with Bonferroni correction to identify specific group differences in payment delays. All pairwise comparisons between credit categories were statistically significant.

The main challenge was presenting these results in an accessible way without overwhelming non-technical audiences. Visual summaries helped translate statistical findings into intuitive insights.

Next week, I will analyze age demographics using Chi-Square testing. Documentation emphasizes interpretation alongside statistical rigor.
